Dot Product Graphs: Investigation of Extreme Dimensions

Sean Bailey*, University of Southern Maine

A dot product graph is a graph $G$ such that there exists a function $f : V(G) \rightarrow \mathbb{R}^k$ such that for $x \cdot y \in V(G)$, $xy \in E(G)$ if and only if $f(x)^T f(y) \geq 1$. The minimum $k$ such that there exists such a function $f$ for $G$ is the dot product dimension of $G$. It was conjectured that the maximum dot product dimension of a graph on $n$ vertices is $\left\lfloor \frac{n}{2} \right\rfloor$.

In this talk, we explore graphs of dot product dimension 1 and graphs with maximum dot product dimension. We will give a correction to the forbidden induced subgraph characterization of graphs with dot product dimension of 1. Also, we will introduce a new, possibly fruitful, approach to proving the conjectured bound of $\left\lfloor \frac{n}{2} \right\rfloor$; in particular, the edge cover of a graph by 1-dot product graphs.

Keywords: dot product graphs, edge covering
